

# Semgrep @ OWASP LA

Finding logic and auth vulns with AI

Code Security for Builders

# Speaker

Traditional SAST catches issues like SQL injection and XSS. Some of the biggest bug bounty payouts come from logic flaws like IDOR, broken authorization, and workflow abuse because these are hard to find with traditional SAST techniques alone.

In this technical workshop, you'll see how Semgrep's AI-powered detection combines static analysis with LLM reasoning to uncover business logic vulnerabilities without custom rule writing.

2026

Prior to AI - generated coding tools

How modern software teams are working today

# AI models detect logic vulns better, but perform poorly on taint style issues

AI models can help find important vulnerabilities that traditional SAST tools struggle with when they lack context beyond the source code and data flows.

## Anthropic Claude Code (v1.0.32, Sonnet 4)

Vulnerability Class	True Positives	False Positives	True Positive Rate
Auth bypass	6	52	10% (6/58)
<b>IDOR</b>	<b>13</b>	<b>46</b>	<b>22% (13/59)</b>
Path traversal	5	31	13% (5/36)
<b>SQL Injection</b>	<b>2</b>	<b>36</b>	<b>5% (2/38)</b>
SSRF	8	57	12% (8/65)
XSS	12	62	16% (12/74)

# LLM context helps to identify vulnerabilities often missed

AI models help find vulnerability classes that SAST and data flow analysis sometimes struggles with.

## IDOR / BOLA

Insecure Direct Object References (IDOR) and Broken Object Level Authorization (BOLA) are the #1 API security risk.

## Business Logic Abuse

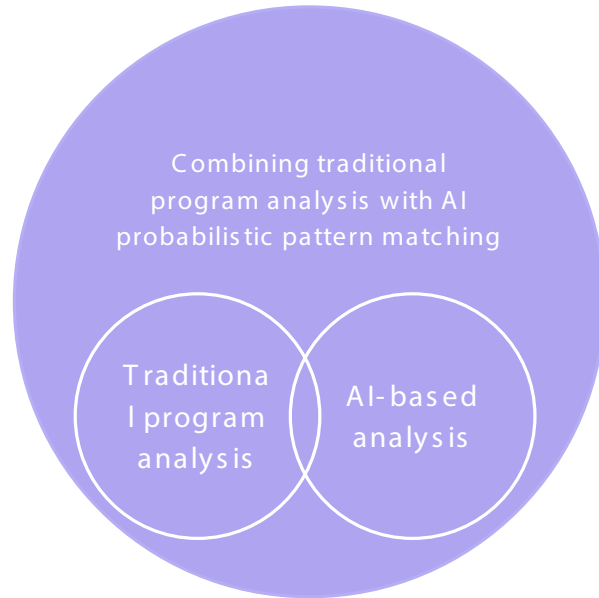

Application state transitions, decision-making, and other flaws used to bypass restrictions or cause disruption.

## And many more

- Crypto Misuse
- TLS Verification Disabled
- Weak Randomness
- CSRF via Authentication Cookie
- JWT Misconfigs
- Missing Rate Limiting
- OAuth Misconfiguration
- Sensitive Data Logging
- Missing Webhook Verification

# Introducing Semgrep Multimodal detection

“With Semgrep, I trust that  
a critical finding will be  
relevant to us.”

Minh Nghiem, Sr. Security Engineer

**homebase**

## Real World Success Stories

“**92%** recall on known IDORs in app”

*Social Media Giant*

“**70%** true positives on IDOR findings so far”

*FinTech Unicorn*

“**88%** precision for IDOR, AuthZ and Logic Issues”

*Fortune 300 FinTech*

# Benefits of Semgrep Multimodal

## **Consistency**

Repeatability and auditability of results.

## **Precision & Recall**

Higher rate of True positives while eliminating vulnerability classes with confidence.

## **Cost**

Manage cost of usage of LLMs at scale.

## **Performance**

Static analysis is fast and efficient.

# Foundation models aren't consistent between runs

The Semgrep Security Research and others have found serious problems with consistency in AI-only approaches.

### How I used o3 to find CVE-2025-37899, a remote zeroday vulnerability in the Linux kernel's SMB implementation

© MAY 22, 2025   SEANHN   11 COMMENTS

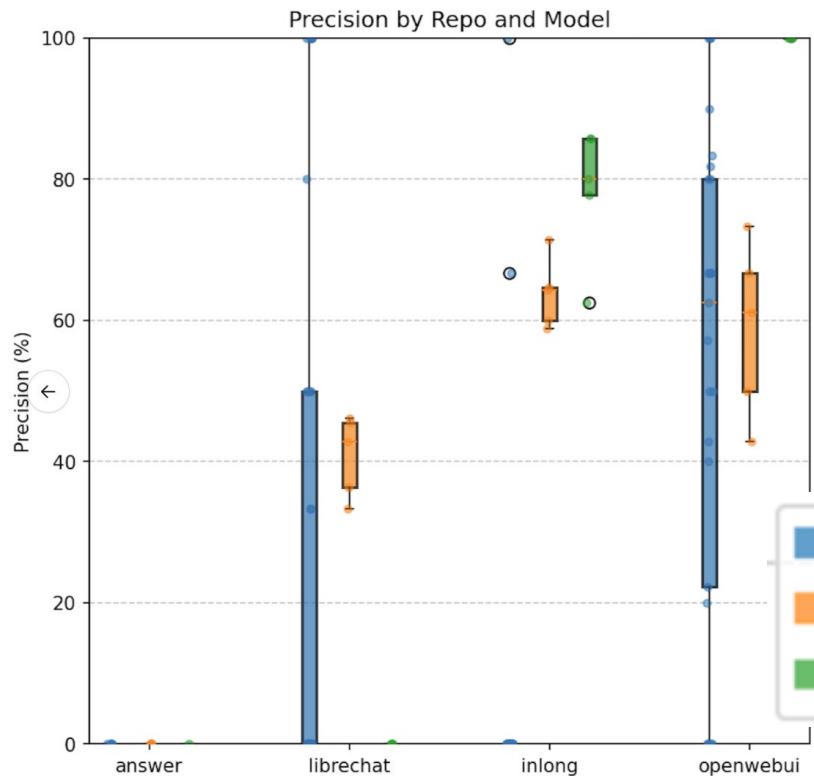

o3 finds the kerberos authentication vulnerability in the benchmark in 8 of the 100 runs. In another 66 of the runs o3 concludes there is no bug present in the code (false negatives), and the remaining 28 reports are false positives. For comparison, Claude Sonnet 3.7 finds it 3 out of 100 runs and Claude Sonnet 3.5 does not find it in 100 runs. So on this benchmark at least we have a 2x-3x improvement in o3 over Claude Sonnet 3.7.

across all of those bugs, but here we'll focus on how o3 found a zeroday vulnerability during my benchmarking. The vulnerability it found is CVE-2025-37899 (fix here), a use-after-free in the handler for the SMB 'logoff' command. Understanding the vulnerability requires reasoning about concurrent connections to the server, and how they may share various objects in specific circumstances. o3 was able to comprehend this and spot a location where a particular object that is not referenced counted is freed while still being accessible by another thread. As far as I'm aware, this is the first public discussion of a vulnerability of that nature being found by a LLM.

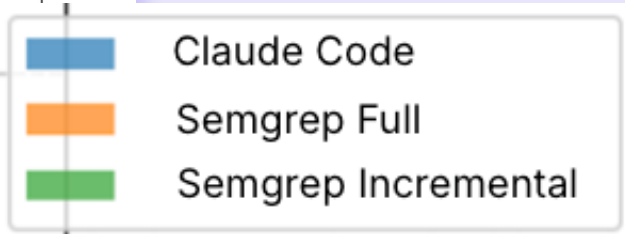

Before I get into the technical details, the main takeaway from this post is this: with o3 LLMs have made a leap forward in their ability to reason about code, and if you work in vulnerability research you should start paying close attention. If you're an expert-level vulnerability researcher or exploit developer the machines aren't about to replace you. In fact, it is quite the opposite: they are now at a stage where they

are significantly more efficient and effective. If you have a problem that can be represented in fewer than 10k lines of code,

Semgrep Multimodal  
reduces variance  
across scans

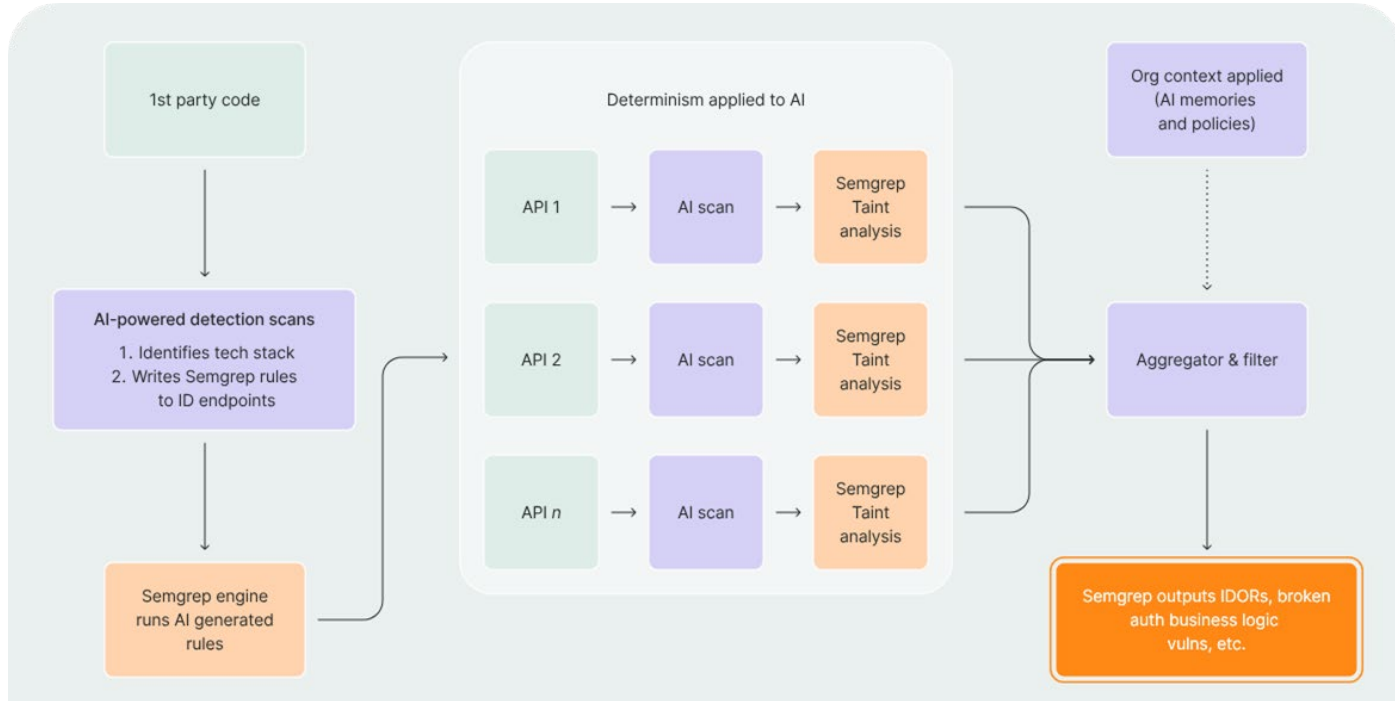

# Slide: Precision & Recall are low

## Anthropic Claude Code (v1.0.32, Sonnet 4)

# Architecting a Multimodal detection workflow

# Semgrep Multimodal delivers 8x True Positives with 50% fewer False Positives

Security expertise improves results over foundational models alone.

	TP Rate (normalized)	FP Rate
Claude	100%	41%
Semgrep	823%	19%

Averaged across runs on a benchmark dataset. (Claude Haiku 4.5)

# Balance of effort and budget with expensive LLM runs

For large code bases, LLMs can be expensive to generate the insights needed for a full review.

product, Wu said. Similar to other AI services, pricing is token-based, and the cost varies depending on code complexity — though Wu estimated each review would cost \$15 to \$25 on average. She added that it's a premium experience, and a necessary one as AI tools generate more and more code.

When it comes to coding, peer feedback is crucial for catching bugs early, maintaining consistency across a codebase, and improving overall software quality.

Anthropic's solution is an AI reviewer designed to catch bugs before they make it into the software's codebase. The new product, called Code Review, launched Monday in [Claude Code](#).

"We've seen a lot of growth in Claude Code, especially within the enterprise, and one of the questions that we keep getting from enterprise leaders is: Now that Claude Code is putting up a bunch of pull requests, how do I make sure that those get reviewed in an efficient manner?" Cat Wu, Anthropic's head of product, told TechCrunch.

## Anthropic launches code review tool to check flood of AI-generated code

# Semgrep Multimodal is so fast that your agents will love it

Semgrep will find and eliminate:

- Injection
- SSRF
- Misconfigured auth
- Supply chain vulns
- Leaked secrets

that might be introduced by AI coding agents before they even end up in a PR.

Let me see it!

Demo

# Semgrep Multimodal goes beyond detection

What if we *didn't* just slap a chatbot onto scan results and call it a day?

## Memories

Updating context and policies to learn about your codebase.

## Autotriage

Filter out false positives with a 96% user agreement rate.

## Autofix

Apply remediation with human-readable PRs and upgrade guidance.

# Combining AI reasoning with rule-based SAST, Semgrep Multimodal performs better at detection, triage, and remediation

AI-generated code is outpacing the security practices built for human-speed development.

## 8x

True positives

**Detected** findings identified with far less noise than using AI models alone.

## 96%

User agreement

Presented with **Autotriage** decisions, real usage data consistently validates signal in the resulting analysis.

## <2 min

Fix PR Time

**Autofix** creates fix PRs in under 2 minutes
